

Modelling Price Outcomes in the Australian NEM

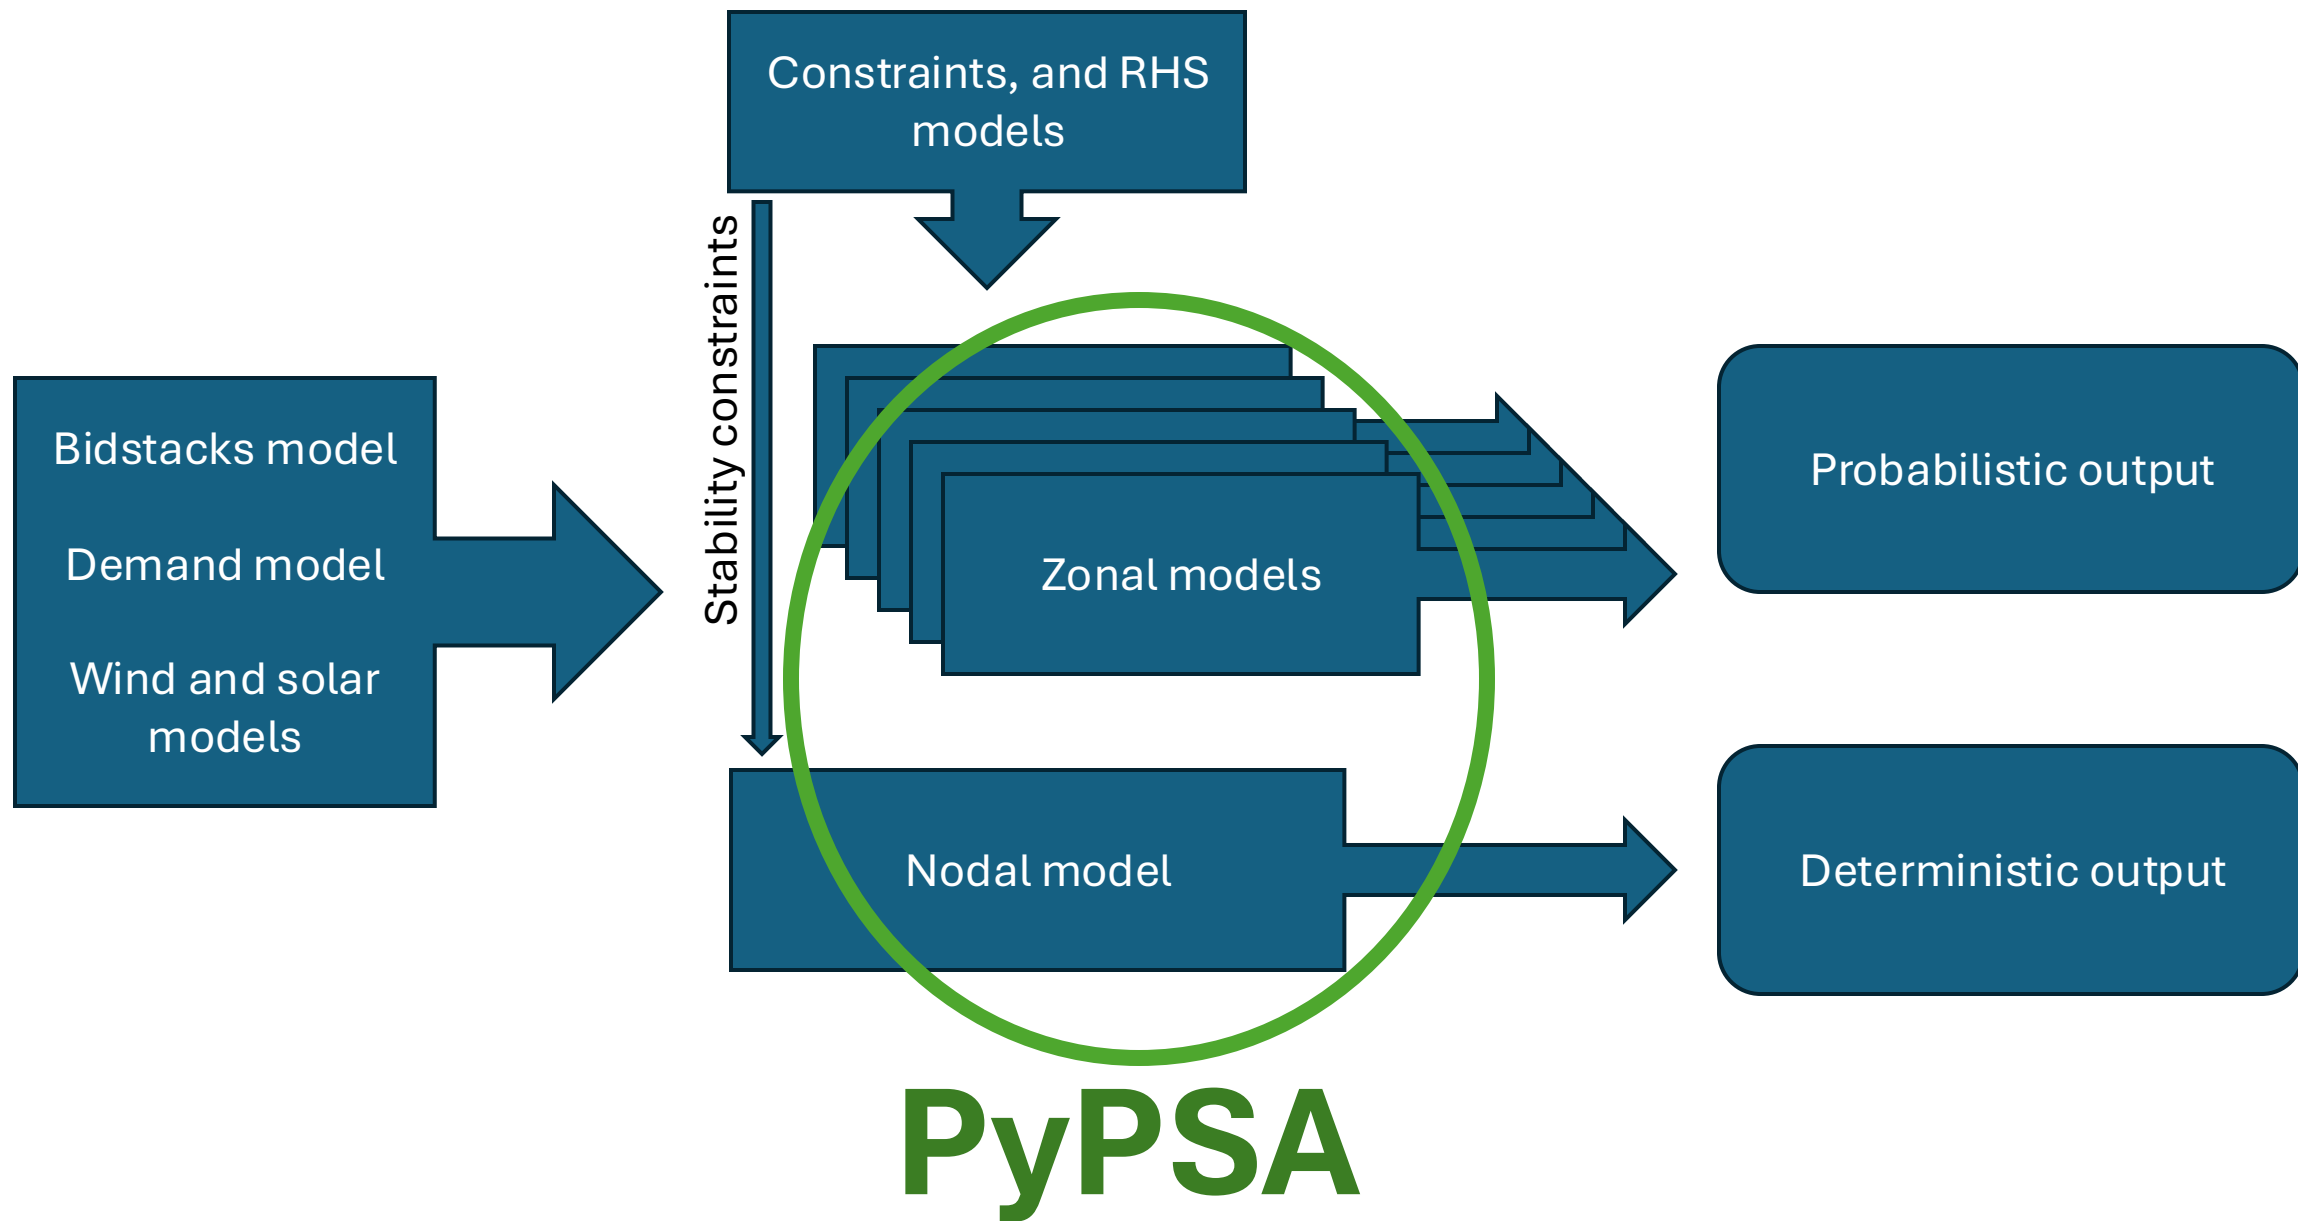

Comparing Nodal and Zonal Market Models in PyPSA

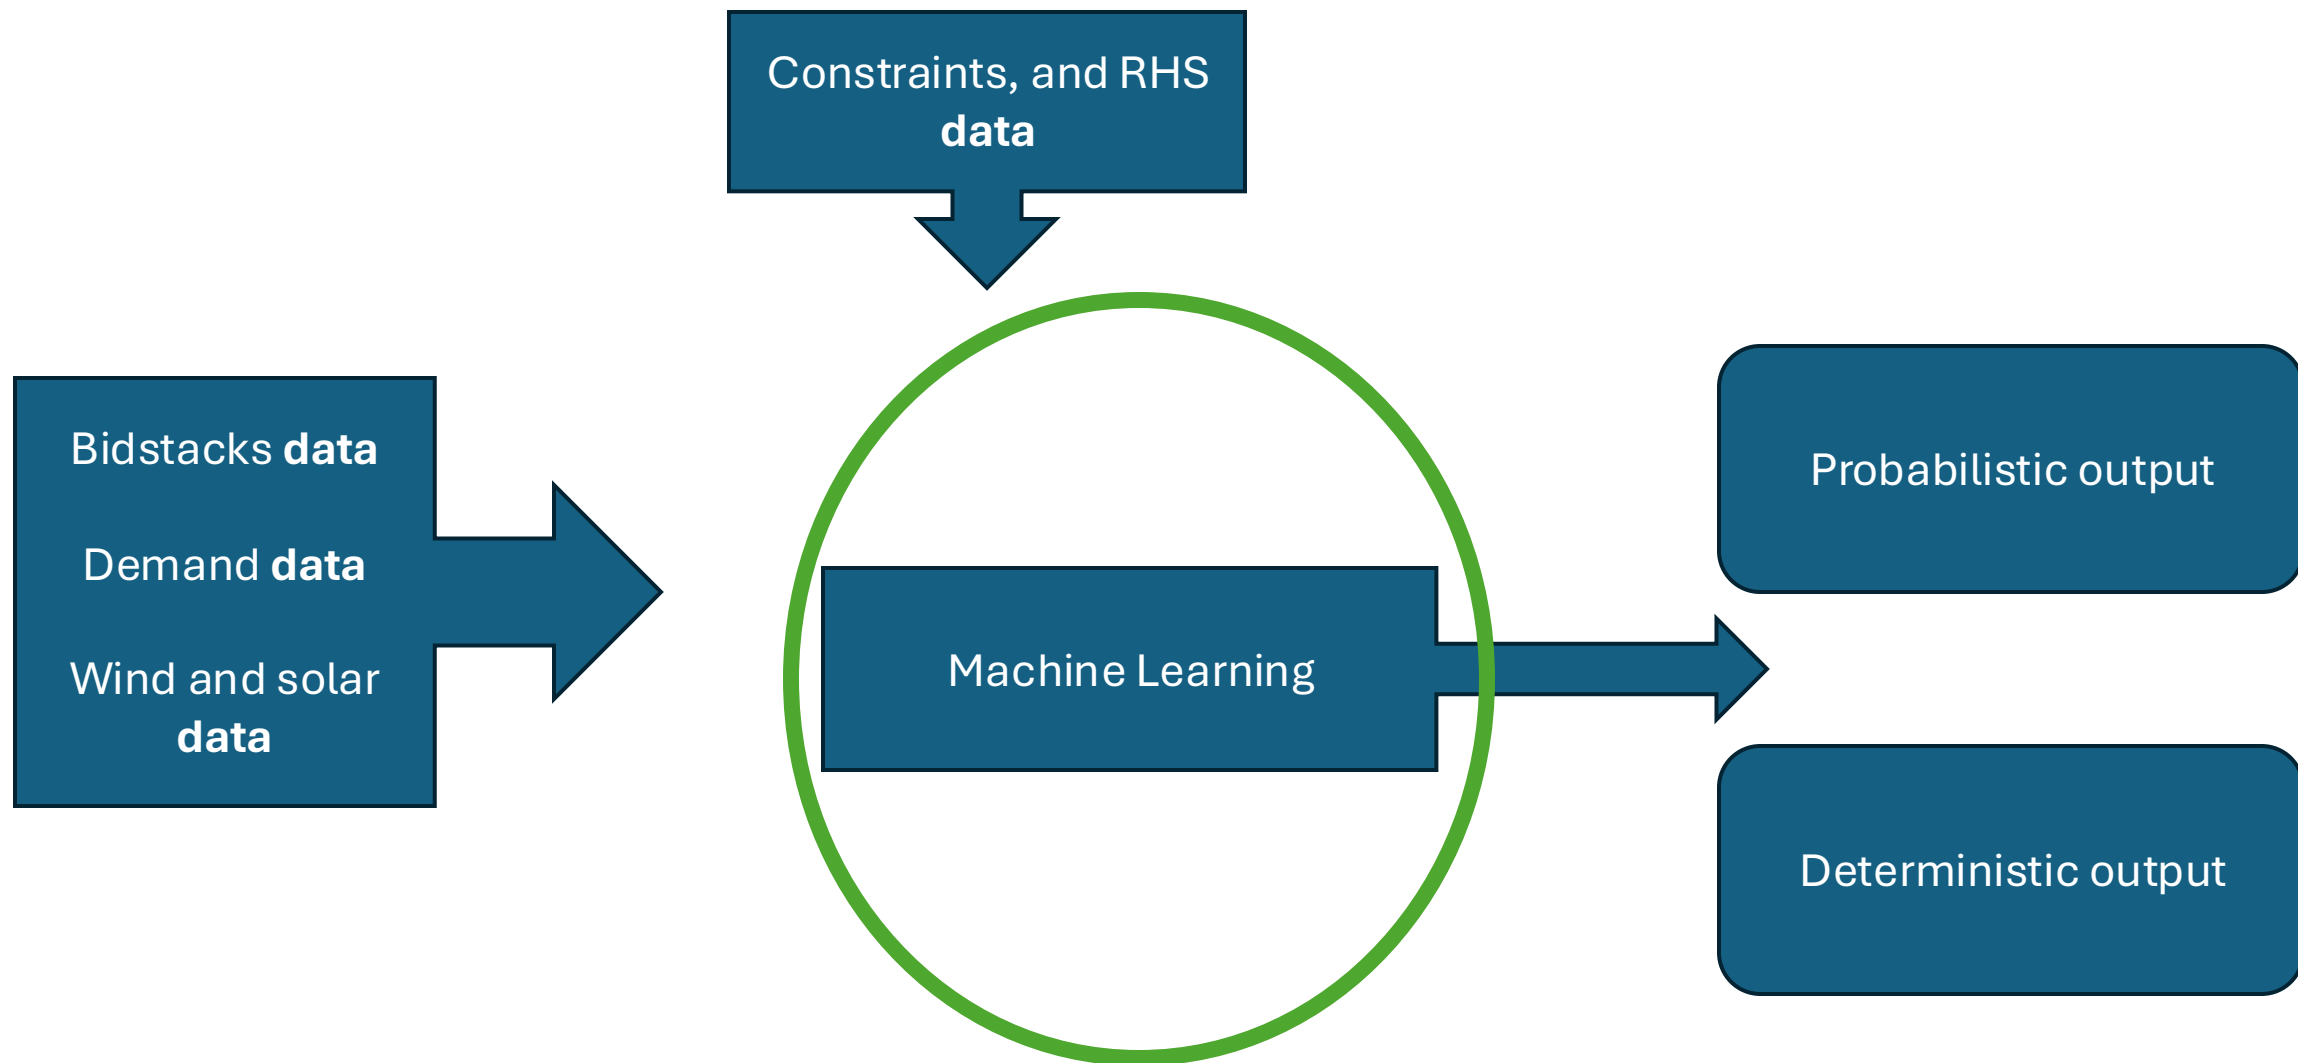

Tom Adams, PyPSA user meeting 2025

Purpose

- **Explainable** week ahead prices in terms of:
 - Generator energy bids (*not SRMC!*)
 - Weather, wind and solar output
 - Demand
 - Plant outages
 - Line outages

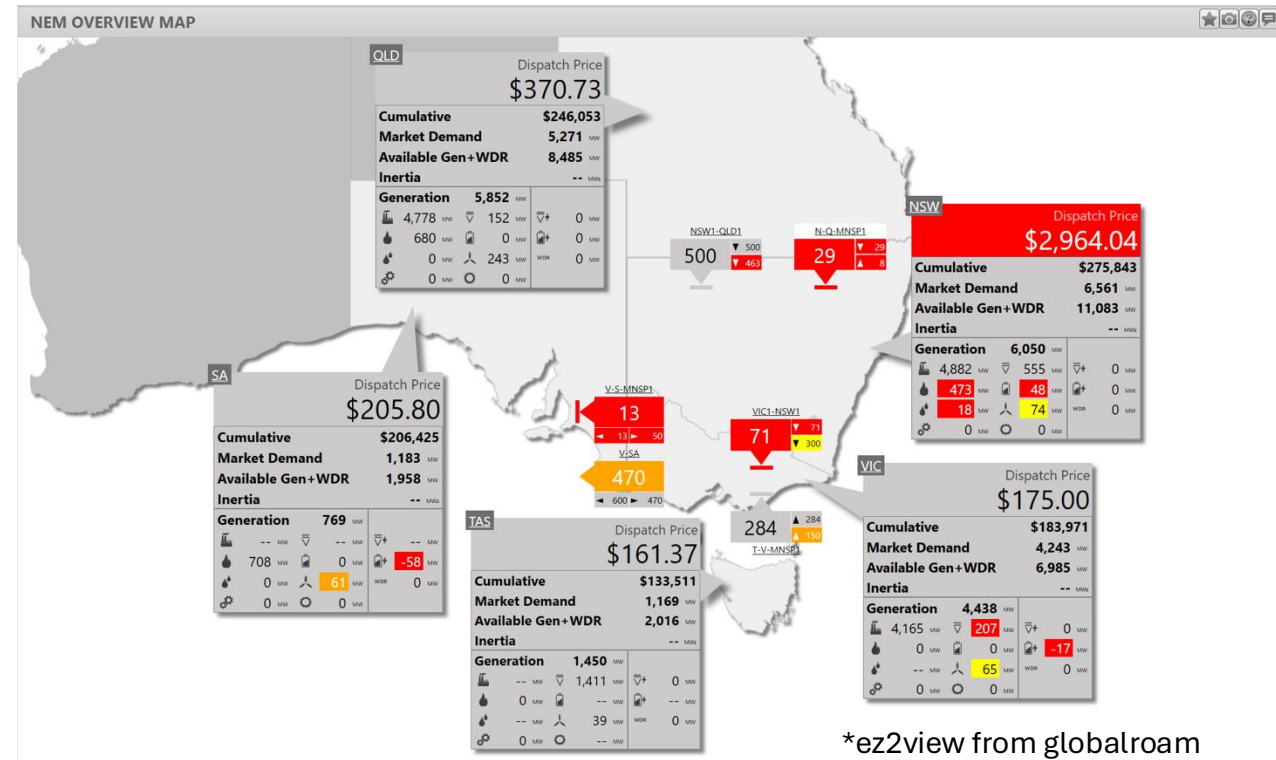

Why not AI?

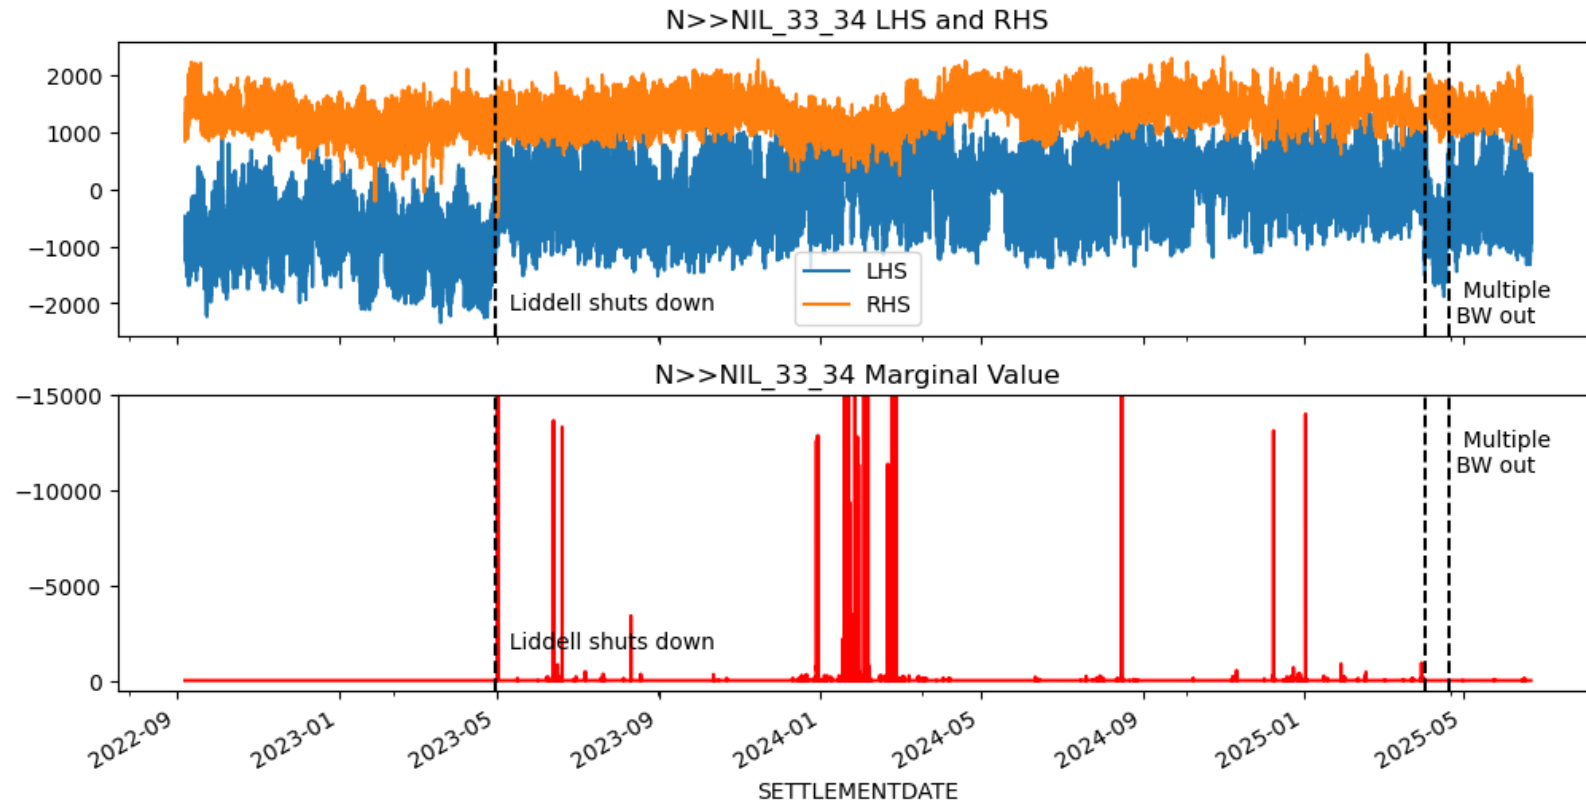

Why use PyPSA at all?

1st May 2023

Why use PyPSA at all?

Out of sample events are happening all the time – generators closing, opening, new lines being added, lines being taken out for maintenance etc.

What about GNNs?

- Train simple graph network on price data with (2,5) and (1,4) out, infer impacts of (3,6) and (3,8) outages

- Works on simple cases
- In reality taking one line out is such a small change to the overall network configuration it tends to get lost in the convolution

PyPSA inputs

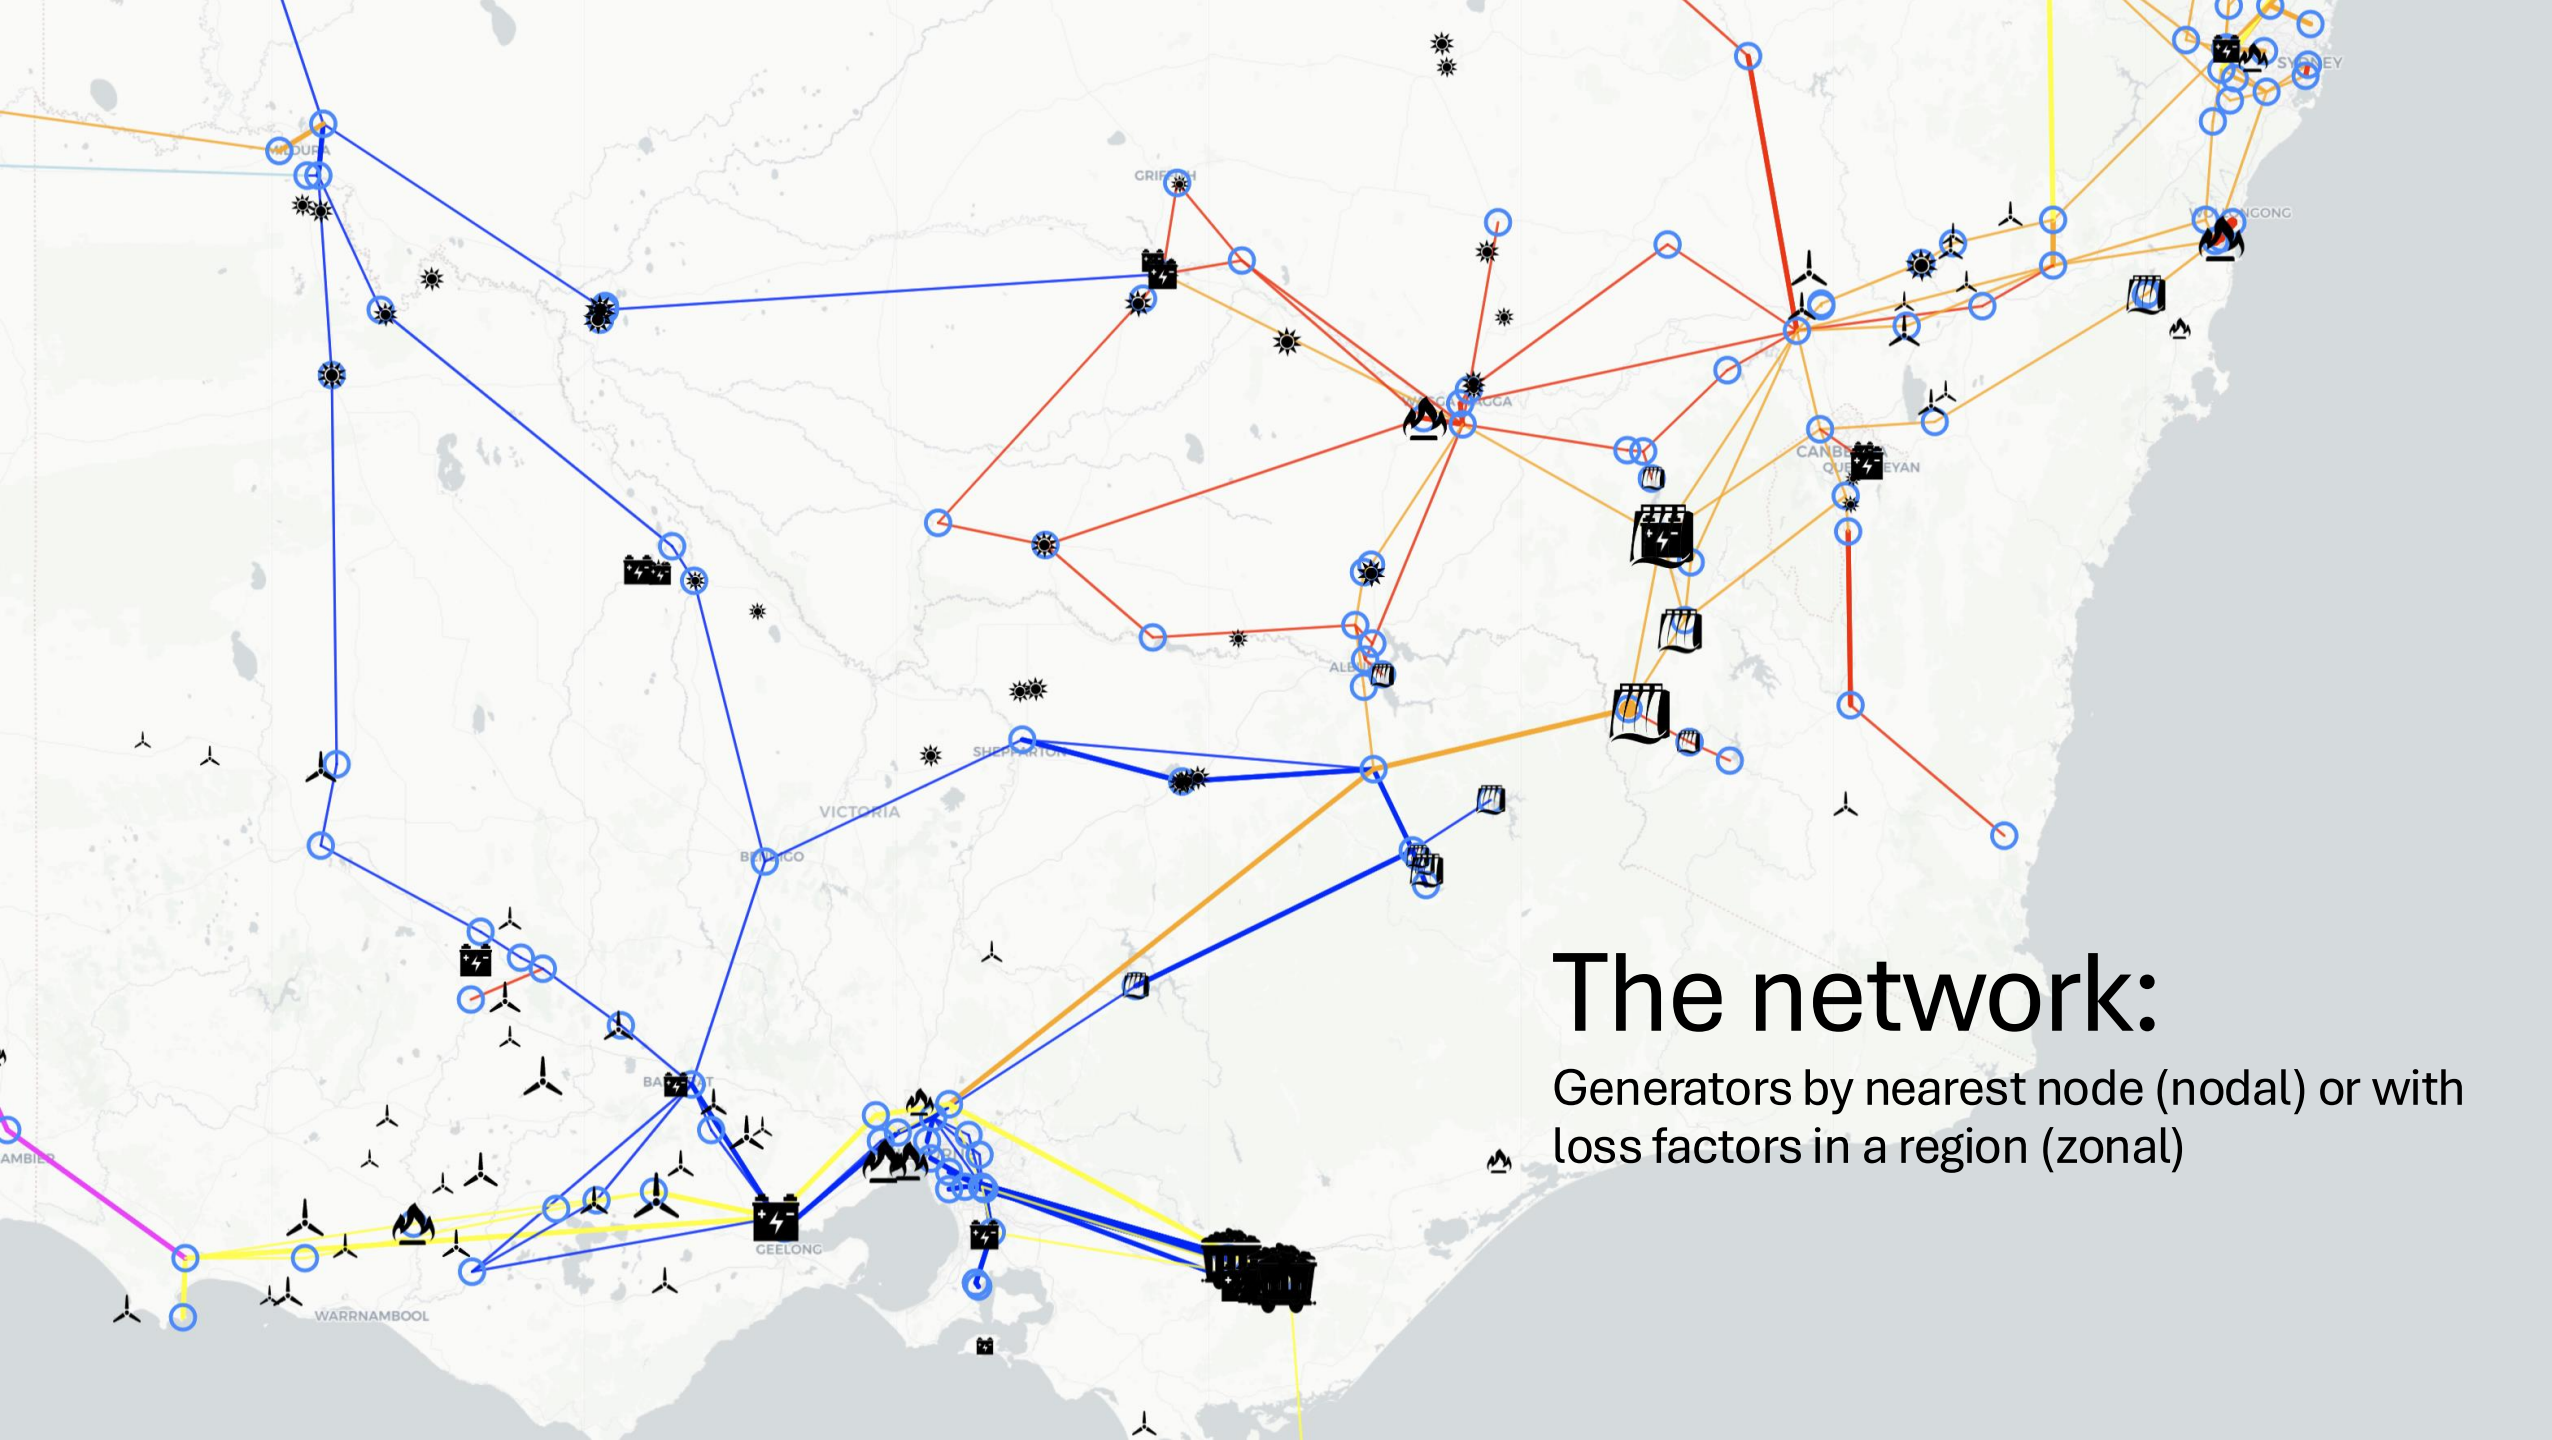

- Bidstacks model predicts power offers in 10 bands per gen
- Other models for upcoming plant and line outages, demand, uncurtailed wind and solar output
- Feed these **stochastic** inputs into a **deterministic** PyPSA market dispatch model

Actual Bids

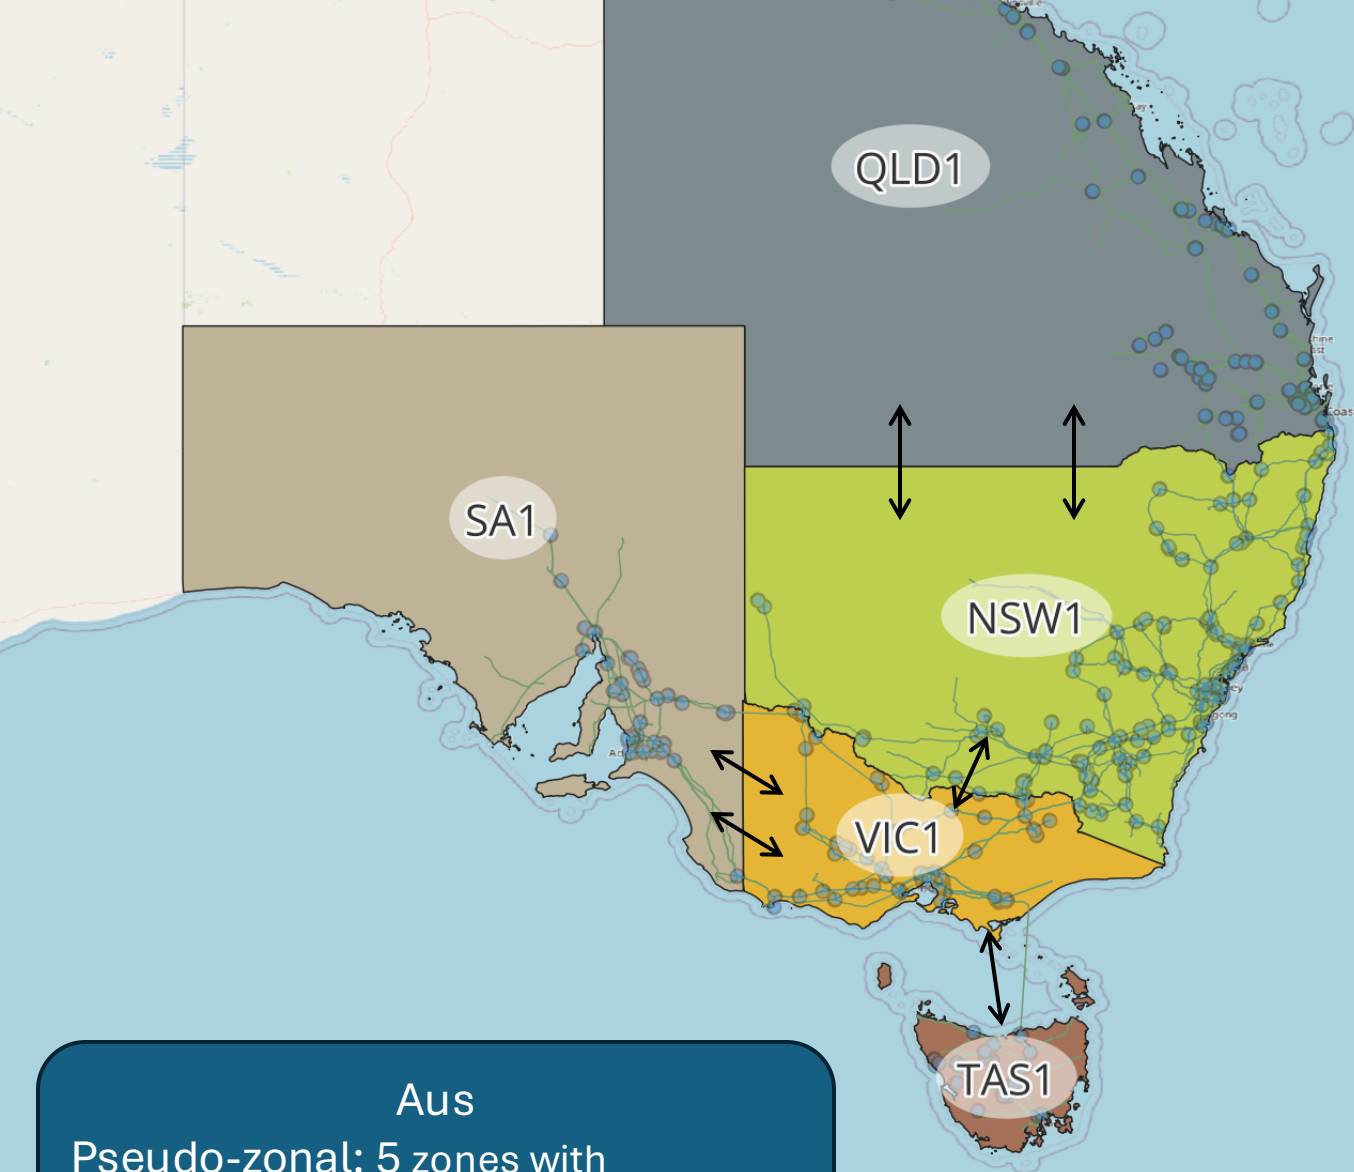

Model Bids

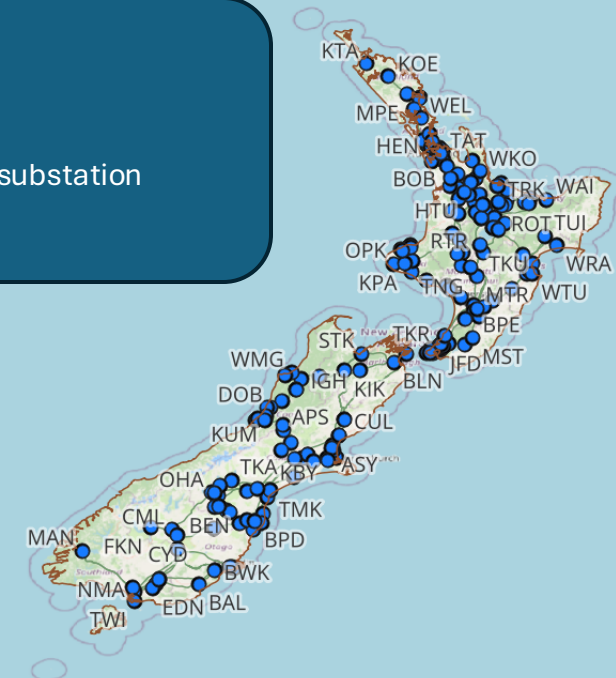

Nodal or zonal?

Aus
Pseudo-zonal: 5 zones with
generator-level loss factors
Nominal interconnectors

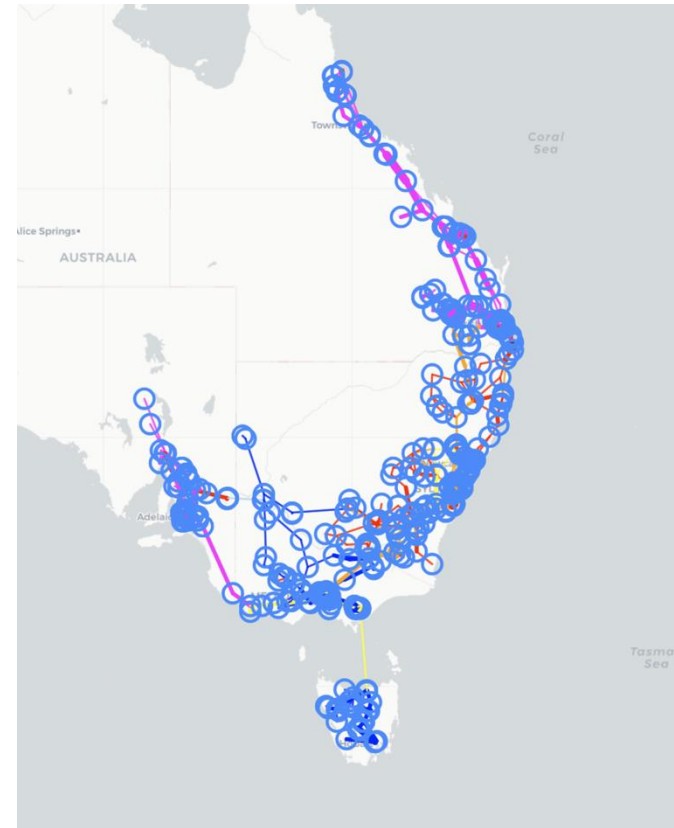

NZ
Nodal: 216 nodes, one for each substation

Zonal

Nodal

Zonal	Nodal
Fast to solve <i>(1 week @30min resolution in 3 minutes)</i>	Slower to solve <i>(1 week @30min resolution in 15 minutes)</i>
Looks more like the market operator's model (NEMDE)	Can handle new scenarios, such as new lines or new line outages
Constraints supplied by market operator	Implicit n-1 thermal constraints
RHSs calculated statistically	RHSs calculated implicitly
Little network information required	Detailed network information required
High level perspective	Can dig into power flow

Zonal

Prob \geq \$1000

Zonal

Price Consistency

Nodal

- Zonal:

- Fast and accurate (depending on inputs)
- Good for day-to-day decision making
- Can be rerun quickly if something changes
- Can be run several times for probabilistic results
- Only uses PyPSA for data handling and solver
- Requires building constraints manually, and tweaks to objective function

- Nodal

- Good for really digging into tricky problems
- Great if no constraint exists, e.g. lines down in storm
- Good when statistical RHSs can't be trusted
- Uses PyPSA extensively, data handling with xarray, calculate constraints, solver.
